Final project: UX/UI CASE STUDY PROJECT

RÍOS VIVOS

Topic

This project focuses on redesigning and optimizing the official website of Ríos Vivos, an environmental organization dedicated to the conservation and protection of rivers, ecosystems, and communities that depend on them. The current website lacks clarity in its structure, user interface, and messaging, which limits the organization's ability to communicate its mission, attract new supporters, and facilitate donations or volunteer sign-ups. Through the application of user-centered design principles and the design thinking methodology, this project aims to enhance the digital experience to better reflect Ríos Vivos' identity, values, and goals.

The new website design will prioritize accessibility, emotional connection, and ease of use for diverse users, including potential volunteers, donors, educators, and activists. By improving information architecture, visual identity, and call-to-action elements, the site will create a seamless path for users to learn about the organization, understand its impact, and get involved. This redesign also seeks to empower the user journey by aligning content with audience needs and optimizing tools that encourage civic participation, environmental awareness, and financial support.

Persona Canvas

Point of view

User: Julia Rivera, a 38-year-old high school chemistry teacher and active environmental volunteer, who is passionate about educating others and supporting local environmental causes.

Need: Julia wants to clearly understand the organization's mission, values, and identity through a transparent website, so she can confidently support it financially and engage her students in meaningful environmental actions.

Insight: Julia believes that for support to be genuine and lasting, people need to connect emotionally and intellectually with the cause. When the organization's mission and actions are clearly communicated through all elements of its design, messaging, values, and user experience, she feels empowered to take action herself and inspire others (especially her students) to do the same.

Wireframes

Option A

Option B

A & B TESTS

- Objective: Compare both wireframe versions to evaluate which one offers a superior user experience.
- Participants: 9 participants (ages 20-80) evaluated both versions.
- Opinions (general comments): Most participants preferred option A because they talked about how organized and clean it looks.
- Conclusion: Most participants preferred option A for its clean and organized layout, which made navigation easier and improved overall usability. It offered a clearer, more user-friendly experience.

¿QUIÉNES SOMOS?

Ríos vivos es un proyecto hospedado y apoyado por diversas organizaciones (universidades, colectivos y fundaciones) e individuos. Desde el año 2017 comenzamos actividades para

BREVE HISTORIA

Ríos Vivos surgió de varias iniciativas previas, que tratamos de explicar a continuación:

Entre 2013 y 2017: previo al año de su formalización como proyecto, diversos actores sociales que eventualmente se hicieron miembros del proyecto, se encontraban activos en proyectos regionales sobre la problemática del agua y la contaminación en la cuenca del Río Santiago-Guadalajara y comunidades cercanas al Lago de Chapala.

En 2017: después de varios años de actividades realizadas sin recursos financieros y mediante trabajo voluntario, se aplica a una convocatoria, y nace en 2017 con el nombre del

A & B FINAL TESTS

A & B TESTS

- Objective: Compare the two prototypes to evaluate which one offers a superior user experience.
- Participants: 3 participants (ages 20-80) evaluated both versions.
- Opinions (general comments): Most participants preferred option A. They mention the simplicity and the clearer look on the texts.

Conclusion: Most participants preferred option A. They feel the text is cleaner and more understandable to navigate with. The only issue was that they didn't understand the images' relation with the projects. So at first glance they chose the second option. Once when it was explained that the images correspond to a placeholder, they chose the first option. This experience is valuable because having a good choice of images even on the prototyping can make a difference.

Final Conclusion:

The main challenge of this project was to redesign the Ríos Vivos website in a way that clearly communicates the organization's mission while improving the user experience. Through empathy mapping and A/B testing with seven participants aged 24 to 60, we learned that users value clarity, organization, and ease of navigation—especially when deciding to support a cause.

Option A stood out for its clean and structured layout, which enhanced usability and aligned with user expectations. This design not only simplifies user interactions but also strengthens trust, directly supporting the organization's goals. In terms of business impact, a more intuitive and transparent website can lead to higher engagement, increased donations, and stronger community support. Overall, this process confirmed that user-centered design plays a key role in both experience and mission-driven communication.
